Jack Frost wants to review all the cocoa breaks he actually took — including the cocoa type and the location he drank it in....

Question 1: Jack Frost wants to review all the cocoa breaks he actually took — including the cocoa type and the location he drank it in. How would you combine the necessary tables to show each logged break with its matching cocoa details and location?

```
SELECT
    location_name, cocoa_name,
    lg.break_id number_of_breaks,
    lg.log_id log_time
FROM
    cocoa_logs lg left join break_schedule br on lg.break_id=br.break_id
    left join cocoa_types ctype on lg.cocoa_id=ctype.cocoa_id
    left join locations loc on br.location_id=loc.location_id
;
```
